Quenyx vOPS HUB — v1.0.0 RC1 · Document v2.0

Document Version	2.0
Software Version	v1.0.0 RC1
Applies To	Quenyx vOPS HUB v1.0.0 RC1
Classification	Internal
Owner	Platform Engineering
Status	Released
Last Updated	2026-06-29
Document Type	Database reference

REVISION HISTORY

Version	Date	Notes
1.0	2026	Initial v1 pack (through Sprint 19).
2.0	2026-06-29	Aligned to v1.0.0 RC1; native QynSight check fields; Sprint 20 AI Workspace tables.

Table of Contents

- 1. Major table groups
- 2. Workspace / user / project tables
- 3. Module / subscription tables
- 4. QynSight tables (observe_*, agents)
- 5. QCIF tables
- 6. AI orchestration tables
- 7. Evidence / gap / recommendation tables
- 8. RAG vector metadata tables
- 9. Important enums
- 10. Key relationships
- 11. Immutability rules
- 12. UUID rules
- 13. Migration notes

09 — Database Reference

Audience: Engineers, DBAs, auditors. **Source:** Derived from `backend/database/migrations` (65 migrations) and models at Sprint 19. Engine: **MySQL** via Eloquent. Regenerate this doc when migrations change.

Conventions. Domain entities (corpus, AI, RAG) use **UUID** identifiers. Corpus content is **immutable + provenance-tracked**. Timestamps are standard Laravel `created_at/updated_at`.

1. Major table groups

Group	Purpose	Representative migrations
Identity & tenancy	Users, projects/workspaces, memberships, invites	<code>create_users_table</code> , <code>create_projects_table</code> , <code>create_project_members_table</code> → <code>rename_project_members_to_memberships</code> , <code>create_project_invites_table</code>
Plans & subscriptions	Plans, module subscriptions, project subscriptions	<code>create_plans_table</code> , <code>create_module_subscriptions_table</code> , <code>create_project_subscriptions_table</code>
Modules & overrides	Module catalog, per-project overrides	<code>create_modules_table</code> , <code>create_project_module_overrides_table</code> , <code>cleanup_non_shield_modules</code>
Integrations	Integration defs + configurations	<code>create_integrations_table</code> , <code>create_integration_configurations_table</code> , <code>create_billing_integrations_table</code>
Audit	Audit log	<code>create_audit_logs_table</code> , <code>qcif_sprint_1_1_audit_hardening</code>
QynSight (observe)	Services, targets, hosts, alerts, metrics, port scans	<code>create_observe_services_table</code> , <code>create_observe_targets_*</code> , <code>create_observe_alert_tables</code> , <code>create_observe_metrics_history_table</code> , <code>create_host_port_scans_tables</code>
Agents	Agents + enrollment tokens	<code>create_agents_tables</code> , <code>enhance_agent_enrollment_tokens</code>
Queue	Jobs	<code>create_jobs_table</code> , <code>create_failed_jobs_table</code>
QCIF corpus	Authorities → frameworks → releases → domains/controls/requirements, revisions, source docs, import runs	<code>create_compliance_corpus_tables</code> , <code>harden_compliance_corpus_schema</code> , <code>qcif_sprint_2_corpus_provenance_preparation</code> , <code>qcif_sprint_2a_versioning_hierarchy</code>
QCIF mapping	Cross-framework mapping	<code>qcif_sprint_8_mapping_foundation</code>
QCIF evidence/gap/rec	Evidence, gap assessment, recommendations	<code>create_compliance_evidence_tables</code> , <code>create_compliance_gap_tables</code> , <code>create_compliance_recommendation_tables</code>
AI orchestration	Conversations/messages metadata	<code>create_ai_orchestration_tables</code>
RAG vectors	Vector index metadata	<code>create_rag_vector_tables</code>

2. Workspace / user / project tables

- **users** — accounts (auth via Sanctum). Profile stats added later; role/preferences columns were added then removed (see `add_role_and_preferences...` + `remove_role_and_preferences...`).
- **projects** — the tenant/workspace entity.
- **project memberships** (renamed from `project_members`) — user↔project with role.
- **project_invites** — pending invitations (token-based accept).

3. Module / subscription tables

- **modules** — module catalog (keys like `qynsight` , `qynshield` , ...).
- **module_subscriptions** / **project_subscriptions** — entitlement of modules to a project/plan.
- **project_module_overrides** — explicit per-project access overrides (audited).
- **plans** — subscription plans.

4. QynSight tables (`observe_*` , **agents**)

- **observe_services** / **observe_service_definitions** — native service-check definitions and instances (check/retry intervals, `engine_key = 'native'`). Exit-code semantics follow the standard 0/1/2/3 = OK/Warning/Critical/Unknown convention used by the QynSight Monitoring Engine.
- **observe_targets** / **observe_targets_services** / **observe_targets_hosts** — monitored targets, their services, and hosts (with public IP).
- **observe_alert tables** — alert rules, events, channels, monitoring profiles, evaluation.
- **observe_metrics_history** — historical metrics.
- **host_port_scans** — port-scan results.
- **agents** / **agent enrollment tokens** — host agents and their enrollment credentials.

5. QCIF tables

Hierarchy (UUID, immutable, provenance-linked):

- **authorities** → **frameworks** → **framework_releases** → **domains** → **controls** → **requirements**.
- **source_documents** — official documents; imported entities carry `source_document_id` .
- **corpus_revisions** — immutable approved snapshots; one **active** per release.
- **import_runs** — record of each import (linked to source doc + entities).

6. AI orchestration tables

- Conversation/message **metadata** tables (`create_ai_orchestration_tables`). **Prompt content is not stored** unless prompt logging is explicitly enabled (default off), and conversations are not persisted unless persistence is enabled (default off).

7. Evidence / gap / recommendation tables

- **Evidence** — evidence records, types, statuses tied to requirements/controls.
- **Gap** — gap assessments correlating evidence to requirements (rule-derived status).
- **Recommendation** — rule-based recommendations with source rule IDs.

8. RAG vector metadata tables

From `create_rag_vector_tables` :

- **rag_vector_indexes** — one row per indexed corpus revision (provider, model, status, provenance; UUID). **No tenant evidence by default.**
- **rag_vector_chunks** — chunk metadata (UUID, content hash, citation linkage). **Metadata only** — no fabricated vectors; real similarity requires a real vector backend.

9. Important enums

- **Alert event status** (observe) — normalized via `fix_observe_alert_events_status_enum` .
- **Evidence status** — e.g., compliant / partially-compliant / no-evidence / expired / rejected / pending (surfaced by the executive scorecard).
- **Corpus revision status** — draft/active (immutability of active revisions).
- **Agent protocol** — migrated `nrpe` → `psap` (`migrate_agent_protocol_nrpe_to_psap`).

10. Key relationships
