Quenyx vOPS HUB — v1.0.0 · Document v2.1

Document Version	2.1
Software Version	v1.0.0
Applies To	Quenyx vOPS HUB v1.0.0
Classification	Public / External
Owner	Product Marketing
Status	Released
Last Updated	2026-06-30
Document Type	Product brochure

REVISION HISTORY

Version	Date	Notes
1.0	2026	Initial v1 pack (through Sprint 19).
2.0	2026-06-29	Aligned to v1.0.0; native monitoring; QynCore vs Integrations clarified; shared platform AI.
2.1	2026-06-30	Added QynSight Operations Intelligence (Sprint 21) — explainable, evidence-grounded operations AI.

Disclaimers about roadmap modules

02 — Product Brochure

Audience: Customers, sales, pre-sales. **Tone:** Sales-friendly, but factual.

Everything below reflects delivered functionality. Items marked  /  /  are flag-gated, architecture-ready, or roadmap and are labelled as such. No fabricated claims.

Quenyx vOPS HUB — your Virtual Operations Center

One platform for operations, compliance, and governable AI. Quenyx unifies infrastructure monitoring, regulatory compliance, and explainable AI on a single multi-tenant workspace model — so your teams stop stitching together disconnected tools.

Platform overview

- **Multi-tenant workspaces** ("projects") with role-based access and per-module entitlements.
- **Shared services** across modules: identity, audit logging, billing/subscription, and a common AI platform.
- **Security-by-default:** AI off until enabled, every compliance answer cited, full audit trail.

Modules

Module	What it does	Status
QynSight	Operations monitoring & observability + Operations Intelligence	 Production-ready (core frozen; intelligence layer live)
QynShield	Compliance intelligence (QCIF)	 Backend/API built
Quenyx AI	Shared, platform-wide governable AI layer	 Foundation built
QynAsset, QynRun, QynKnow, QynNotify, QynReact, QynVA, QynSupport, QynBalance	Platform modules	 Registered internally, currently disabled in the navigation until production rollout

QynCore is the platform core (not a business module): it provides the internal services through which all modules communicate — Platform Event Bus, Shared Services, Module Registry, Service Registry, AI Context Broker, Permission Broker, Audit Pipeline, Notification Broker, Workspace Context, and Domain Events. **Integrations** is a platform page for **external** systems only (cloud, identity, ITSM, security tooling, messaging); it is not a module and does not carry internal module-to-module traffic.

QynSight overview

Real-time **monitoring, infrastructure map, performance analytics, capacity planning, alert management, service checks, and host/agent enrollment**. Agents report metrics, inventory, and heartbeats; alert rules and monitoring profiles are configurable per workspace. QynSight's core monitoring engine is **production-ready and feature-frozen** at v1.0.

Operations Intelligence (Sprint 21)

QynSight now **understands and explains** your operations, not just charts them:

- **Monitoring Copilot** — ask "Which hosts are unhealthy?", "Summarize today's alerts", "What changed in the last 24 hours?", "Which hosts will run out of storage first?" — answered from your **current** hosts, services, alerts, capacity, metrics, and topology.
- **Alert Intelligence** — ✨ Explain / ✨ Investigate on every alert: operational impact, most likely causes, the evidence used, related alerts, and suggested actions.
- **Deterministic Root-Cause Analysis** and **auto-generated Incident Timelines** from real events.
- **Capacity, Performance, Infrastructure, and Service-Health intelligence** with **evidence-based recommendations** — every recommendation references real metrics, alerts, capacity, or dependencies.
- **Contextual ✨ Quenyx AI actions** on hosts, services, alerts, capacity, and the infrastructure map, plus a dedicated **Operations Intelligence dashboard**.

It **reuses the same governable Quenyx AI platform** — explainable, deterministic-first, and **never fabricated**: if the evidence is insufficient, it says so. Available in English and Arabic.

QynShield overview (backend/API)

Compliance built on the **QCIF** engine:

- **Official corpus** — NCA **ECC-2:2024 Revision v1** (5 domains, 108 controls, 108 requirements).
- **Knowledge Graph** and **Cross-Framework Mapping**.
- **Evidence Intelligence, Gap Assessment, Recommendation Engine**.
- **Compliance Copilot** and an **Executive dashboard / scorecard / timeline / explainability**. Every answer is **cited to an official source** — no source, no answer.

Quenyx AI overview /

A **shared AI platform**, not a bolt-on chatbot:

- **Provider abstraction** (mock + OpenAI) — no model is hardcoded.
- **Skills** that reuse the compliance engines (corpus, graph, mapping, evidence, gap, recommendation).
- **Deterministic reasoning first**, AI used only to render explanations.
- **Mock mode by default**; real-model and **RAG** are feature-flagged.

Deployment model

- **Self-hosted on your infrastructure** (Ubuntu + Nginx). Laravel backend, React frontend, and a Node gateway. Standard relational database, queues, scheduler, and cache.
- Configuration is environment-driven; AI/RAG are opt-in.

Key benefits

- **Consolidation** — operations + compliance + AI in one place.
- **Auditability** — provenance and citations on every compliance answer.
- **Safe AI adoption** — explainable, deterministic-first, off by default.
- **Extensible** — modular architecture; new modules inherit identity, billing, and AI.

Screenshots

(Placeholders — insert current UI captures before distribution.)

- [screenshot: QynSight infrastructure map]
- [screenshot: QynShield executive dashboard]
- [screenshot: Compliance Copilot with citations]

Demo workflow

1. Sign in and select a **workspace**.
2. **QynSight**: view real-time metrics, infra map, alerts, capacity advisor.
3. **QynShield**: open the executive dashboard → scorecard → timeline → ask the Copilot a question and see **cited** reasoning (mock mode is safe for demos).
4. **Quenyx AI**: call the capability catalog to show the governable AI platform behind it.

Call to action

Book a guided demo of QynSight monitoring and the QynShield compliance engine on your own workspace. Start with monitoring today; layer in compliance and AI as you grow.

Asset Intelligence + AI Adapter Platform (Sprint 22)

Quenyx AI is now a true **platform**: every module plugs in through a shared, discoverable **AI adapter** — no per-module AI silos. **QynAsset Asset Intelligence** is the newest AI experience: it explains your **real discovered inventory** (new/changed/inactive/duplicate assets, dependencies, hardware/capacity, lifecycle) and gives **evidence-based** recommendations. Where data isn't collected (e.g. software licenses

or warranty dates), Quenyx AI says so plainly instead of inventing it — the same trust-first principle behind every Quenyx AI answer.

Disclaimers about roadmap modules

Modules other than QynSight and **QynAsset** (and the QynShield surfaces noted above) are **on the roadmap** and are **intentionally hidden in the UI** today. Real-model AI and RAG are **feature-flagged** and disabled by default. Only **NCA ECC-2:2024** is currently loaded. No performance benchmarks, certifications, or customer claims are made in this brochure.
