Quenyx vOPS HUB — v1.0.0 · Document v2.0

Document Version	2.0
Software Version	v1.0.0
Applies To	Quenyx vOPS HUB v1.0.0
Classification	Public / External
Owner	Product
Status	Released
Last Updated	2026-06-29
Document Type	User guide

REVISION HISTORY

Version	Date	Notes
1.0	2026	Initial v1 pack (through Sprint 19).
2.0	2026-06-29	Aligned to v1.0.0; modules disabled-in-navigation framing; QynCore vs Integrations clarified.

Table of Contents

- 1. Dashboard
- 2. Workspace selection
- 3. QynSight flows 
- 4. AI Agent expected flows 
- 5. QynShield future user flows 
- 6. Onboarding workflow
- 7. Navigation
- 8. Common tasks
- 9. Troubleshooting
- 10. Modules currently disabled in the navigation

13 — Customer User Guide

Audience: End users. **Scope:** What you can do in the product today. Modules not yet visible are clearly marked.

1. Dashboard

After signing in you land on your **dashboard**, scoped to your selected workspace. It summarizes the operational state surfaced by QynSight for that workspace.

2. Workspace selection

Use the **workspace selector** (top of the app) to switch between workspaces you belong to (e.g. **Production Env**, **Staging Env**). All data — monitoring, compliance, members — is scoped to the active workspace.

3. QynSight flows

QynSight is the visible, production module:

- **Real-time Monitoring** — live host/service metrics. (*Requires the scheduler running; otherwise shows "Last poll: never".*)
- **Infrastructure Map** — topology of hosts/connections; export as JSON/PNG.
- **Performance Analytics** — performance metrics and thresholds.
- **Capacity Planning** — capacity advisor + export.
- **Alert Management** — alert rules, history, acknowledge events, channels, monitoring profiles.
- **Service Checks** — run checks; service definitions and statuses.
- **Hosts / Targets** — add and manage monitored targets; run port scans.
- **Agent enrollment** — generate an enrollment token and install the agent on a host.

4. AI Agent expected flows

- An **AI Agent** entry point exists in the UI (knowledge-base agent for QynSight).
- The **Compliance Copilot** (QynShield) answers compliance questions with **citations**. By default it runs in **mock mode** (safe, deterministic) unless your operator has enabled real-model AI.
- AI never invents answers: if it can't cite an official source, it won't answer.

5. QynShield future user flows

QynShield's compliance engine (corpus, evidence, gap, recommendations, executive dashboard, explainability, Copilot) is available via **API today**, with the **executive/demo** surface as the current UI. Full self-service compliance UI is on the roadmap.

6. Onboarding workflow

1. Accept your invite and sign in.
2. Select your workspace.
3. (QynSight) Add hosts/targets → install agents → watch monitoring populate.
4. (QynShield, if entitled) Explore the executive dashboard and ask the Copilot a question.

7. Navigation

- **Sidebar:** modules you can access (today: **QynSight**). Other modules are **not yet visible**.
- **Workspace selector:** switch tenant context.
- **Getting started:** guided steps from the sidebar.

8. Common tasks

Task	Where
See system health	Dashboard / Real-time Monitoring
Add a monitored host	Monitored Targets
Investigate an alert	Alert Management → history
Acknowledge an alert event	Alert event → acknowledge
Export the infra map	Infrastructure Map → export
Ask a compliance question	Compliance Copilot (if entitled)

9. Troubleshooting

- **"Last poll: never" / stale data** → the scheduler/cron isn't running (contact your admin).
- **Port scan never completes** → the queue worker isn't running (admin).
- **Can't see a module** → it's hidden by design today, or your workspace isn't entitled.
- **Copilot says it can't answer** → expected when there's no citable source; rephrase or scope to a loaded framework (NCA ECC-2:2024).
- **403 Unauthorized** → you're not a member of that workspace, or lack the module entitlement.

10. Modules currently disabled in the navigation

QynAsset, QynRun, QynKnow, QynNotify, QynReact, QynVA, QynSupport, and QynBalance are existing platform modules that are **intentionally disabled in the navigation** by a sidebar feature flag until their production rollout. They are not removed — they are switched off in the UI only. Today **QynSight** is the visible module (with **QynShield** available where entitled / via the executive surface).

QynCore is not a module you navigate to — it is the platform core that lets modules work together behind the scenes. **Integrations** is a platform page for connecting Quenyx to **external** systems (for example Microsoft, Azure, AWS, Google Cloud, ServiceNow, Jira, Slack, Active Directory).
