Executive Intelligence & Enterprise Analytics Guide

What it is

Sprint 25 adds two evidence-based platform surfaces consumed through QynVA:

- **Executive Intelligence** (`app/Services/Platform/Executive/ExecutiveIntelligenceService.php`) — board-ready health, KPIs, top risks/recommendations, and an AI-narrated executive summary.
- **Enterprise Analytics** (`app/Services/Platform/Analytics/EnterpriseAnalyticsService.php`) — the shared metrics platform (MTTD/MTTR, trends, effectiveness, adoption, KPIs).

Both are pure **read-models** over real rows and are **honest**: when there is not enough data, a metric returns `available: false` with a reason instead of inventing a number. Health scores are **deterministic functions of real counts**, documented inline, so identical data always yields the identical score.

Executive Intelligence

GET `/api/qynva/executive` returns:

Block	Basis
Operational Health	100 – weighted penalties for open critical/high incidents and open alerts
Infrastructure Health	share of monitored services currently in an <code>ok</code> state
Compliance Health	compliance assessment presence (QynShield), honest when absent
Capacity Forecast	metric-sample availability (pointer to QynSight Capacity Planning)
Top Risks	real open critical/high incidents + open critical alerts
Top Recommendations	QynBalance evidence-based optimization recommendations
Automation Success / AI Usage	from Enterprise Analytics
Incident / Knowledge / Cost KPIs	MTTR/MTTD/trends, knowledge usage, cost rollup

POST `/api/qynva/executive/summary` narrates the **deterministic dashboard evidence** through `ModuleAiNarrator` (mock-safe; flagged `ai_enabled: false` when AI is disabled). The summary never introduces facts that are not in the dashboard.

Health bands: `healthy` (≥ 85), `degraded` (≥ 60), `at_risk` (< 60).

Enterprise Analytics

GET `/api/qynva/analytics?days=30` returns:

- **MTTD** — alert `triggered_at` → `acknowledged_at` (detection proxy).
- **MTTR** — incident `opened_at` → `resolved_at`, plus an alert MTTR companion.

- **Incident trends** — opened/resolved and by-severity over the window.
- **Automation effectiveness** — execution status mix, success rate, rollbacks.
- **AI adoption** — conversations, tokens, by provider.
- **Knowledge usage** — documents by status.
- **Asset growth** — hosts, agents, services.
- **Capacity trends** — metric-sample availability.
- **Notification statistics** — by severity/status/channel.
- **Executive KPIs** — open incidents/tickets/alerts, active notifications, knowledge documents.

Each block reports availability honestly; durations are returned in seconds plus a human form (e.g. 2.3h).

RBAC & isolation

Workspace-scoped, UUID-only. Reads require `accessAi` ; the executive AI summary requires `can_use_ai` . All data is workspace-isolated.

UI

Reached via the QynVA hub: **Executive Intelligence** (`/qynva/executive`) and **Enterprise Analytics** (`/qynva/analytics`). EN/AR complete.
