Migration Guide — Upgrading to Quenyx vOPS HUB v1.0.0

Summary

Sprint 25 is **additive**. It introduces new shared services, two new module surfaces (QynVA, QynBalance), and enables the full navigation. There are **no breaking changes** to Sprint 20–24 behavior and **no destructive migrations**. Upgrading is low-risk.

Pre-upgrade checklist

- ☐ Back up the database (standard pre-deploy snapshot).
- ☐ Confirm you are on v1.0.0 (Sprint 24) and migrations are current (`php artisan migrate:status`).
- ☐ Note your current AI provider configuration (unchanged by this release).

Upgrade steps

```
# 1. Pull the v1.0.0 release
git fetch --tags && git checkout v1.0.0

# 2. Backend dependencies + migrations (idempotent; Sprint 24 collaboration tables are guarded)
cd backend
composer install --no-dev --optimize-autoloader
php artisan migrate --force

# 3. Clear & rebuild caches
php artisan config:clear && php artisan cache:clear && php artisan route:clear
php artisan config:cache && php artisan route:cache

# 4. Frontend
cd ../frontend
npm ci
npm run build
```

Configuration changes

New (optional) — QynBalance pricing — `config/cost.php`

QynBalance works without any pricing config (it reports real **counts** and "pricing unavailable"). To unlock monetary estimates, set real rates from your own contracts/cloud bills:

```

COST_CURRENCY=USD
COST_HOST_PER_MONTH= ...      COST_AGENT_PER_MONTH= ...      COST_SERVICE_PER_MONTH= ...
COST_LICENSE_PER_SEAT= ...    COST_AUTOMATION_RUN_MINUTE= ...
COST_MONTHLY_BUDGET= ...      COST_IDLE_AGENT_HOURS=72

```

Do not invent rates. Leave any rate unset if you don't have a real figure — QynBalance will remain honest rather than fabricate.

Unchanged

AI provider settings, AI workspace flags, entitlements/plans, and all Sprint 20–24 env keys are unchanged.

Entitlements

QynVA and QynBalance are `ai_candidate ⇒ true` and ship enabled in the navigation. They are gated, like every module, by **plan/workspace entitlements** and AI RBAC (`accessAi` , `can_use_ai` , `administerAi`). Add `qynva` / `qynbalance` to the relevant plan's `modules_allowed` to expose them to a workspace.

Navigation change

The temporary sidebar feature flag is removed; all business modules are visible. `qyncore` and `qynintegrations` are platform-only and intentionally not shown as customer modules. No action needed.

Post-upgrade verification

- ☐ `GET /api/qynva/operator/capabilities` returns the discovered module catalog.
- ☐ `GET /api/qynva/health` (admin) reports `operational` (or explains any `degraded` area).
- ☐ `GET /api/qynbalance/cost/overview` returns counts (+ monetary only if rates configured).
- ☐ Sidebar shows QynSight, QynAsset, QynRun, QynReact, QynKnow, QynSupport, QynNotify, QynShield, QynBalance, QynVA.
- ☐ Sprint 20–24 surfaces behave exactly as before (no regressions).

Rollback

Sprint 25 adds no destructive migrations. To roll back, redeploy the previous tag and restore caches; no data migration reversal is required.
