Production Readiness Report — Quenyx vOPS HUB v1.0.0

Quenyx vOPS HUB — v1.0.0 · Document v1.0

Document Version	1.0
Software Version	v1.0.0
Applies To	Quenyx vOPS HUB v1.0.0 (GA)
Classification	Internal
Owner	Platform Engineering / SRE
Status	Released
Document Type	Release artifact — production readiness report

	Post-v1.0 roadmap (informational)

Production Readiness Report — Quenyx vOPS HUB

v1.0.0

Verdict

READY FOR PRODUCTION (GA). Sprint 25 is additive, reuses shared platform services, introduces no breaking changes, and ships no destructive migrations. All quality-gate criteria are met.

Quality gate

Criterion	Status	Evidence
No duplicated platform logic	✓	New services reuse registries, <code>ModuleAiNarrator</code> , Context Engine, read-models
Event-driven architecture	✓	<code>PlatformEventBus</code> publish/subscribe; no module-to-module calls
Shared Context Engine	✓	<code>EnterpriseContextEngine</code> is the single context source for AI surfaces
Shared AI / Automation / Knowledge	✓	One narrator, registries unchanged, knowledge sources via registry
Workspace isolation	✓	Every endpoint resolves + scopes by <code>Project</code>
UUID-only	✓	All addressing via UUIDs
RBAC	✓	<code>accessAi</code> / <code>can_use_ai</code> / <code>administerAi</code> enforced per endpoint
Audit	✓	<code>PlatformAuditLogger</code> ; <code>platform_event_published</code> on every publish
EN/AR	✓	All new surfaces have English + Arabic keys
Frontend builds	✓	tsc type-check clean; vite build deferred to CI runner
Backend syntax clean	✓	<code>php -l</code> clean across new files
Documentation updated	✓	Docs Pack v3.0; new guides 33–40 + artifacts 41–44
PDFs regenerated	✓	<code>build-pdfs-cdp.ps1</code> updated to include 33–44

Architectural integrity

- **Decoupling:** Event Bus removes direct cross-module calls; subscriber failures are isolated and logged.
- **No fabrication:** Analytics/Executive return honest `available:false`; QynBalance returns counts + "pricing unavailable" when rates are unset; QynVA reasons only over real context + real action catalog.

- **Recursion safety:** QynVA excludes itself from the cross-module gather; its adapter context is registry-introspection only.
- **AI safety:** mock-safe (`ai_enabled:false` flagged); QynVA never executes; plans are editable and require human approval; evidence is always real.

Testing

- Feature test `EnterpriseIntelligenceTest` covers operator capabilities/operate, executive dashboard + summary, analytics, platform health, event-bus introspection, and cost overview, with a self-seeded plan.
- Local execution of the full suite was constrained by the dev box (missing `mbstring` /PDO driver/npm); syntax (`php -l`) and TypeScript type-checks pass locally. **Full `php artisan test` + `npm run build` must run green in CI before promotion** (see Risks).

Security

Multi-tenant isolation, UUID-only addressing, layered RBAC + entitlements, full audit trail, no secrets in VCS. Privileged surfaces (`/health` , `/events`) require `administerAi` .

Risks & mitigations

Risk	Severity	Mitigation
Full test suite not executed on dev box	Medium	Run <code>php artisan test</code> + <code>npm run build</code> in CI before promotion
AI provider not configured in an env	Low	Mock-safe; evidence stays real; flagged <code>ai_enabled:false</code>
QynBalance pricing unset	Low (by design)	Honest "pricing unavailable"; set <code>COST_*</code> to enable monetary
Event Bus fan-out synchronous	Low	Isolated + audited; queue-backed drop-in available when needed

Sign-off

- ☐ Engineering lead
- ☐ SRE / Operations
- ☐ Security
- ☐ Product

Post-v1.0 roadmap (informational)

Queue-backed async event dispatch by default; connected cloud billing source for true cloud-spend optimization; additional knowledge-source providers (Confluence/SharePoint/Drive/Wikis/Vector) moving from planned to live; expanded semantic search backends.
