Quenyx vOPS HUB — v1.0.0 RC1 · Document v1.0

Document Version	1.0
Software Version	v1.0.0 RC1
Applies To	Quenyx vOPS HUB v1.0.0 RC1 — Sprint 24
Classification	Internal
Owner	Platform Engineering
Status	Released
Document Type	Module / platform guide

Enterprise Knowledge Guide (QynKnow)

What QynKnow is

Sprint 24 turns **QynKnow** into the **Enterprise Knowledge Platform** — a shared, reusable platform capability (not an isolated module). It provides a registry of knowledge sources, an enterprise + semantic search interface across every module, an Enterprise Knowledge Graph v2, a Global Timeline, and an AI **Knowledge Assistant** that explains, summarizes, relates, and drafts — always grounded in real indexed evidence and **never fabricating** content.

Everything reuses the existing shared platform: the **AI Adapter Registry**, the **ModuleAiNarrator** runtime, the workspace/RBAC envelope, and the audit pipeline. No AI, automation, or orchestration logic is duplicated.

Mental model

Knowledge Source Registry

A dynamic registry (`App\Services\Knowledge\KnowledgeSourceRegistry`) of providers implementing the `App\Contracts\Knowledge\KnowledgeSource` contract. Search and the Assistant consume providers **only** through the registry — there is **no provider-specific branching**.

- **Internal Knowledge Base** (`internal`) — always operational, backed by the `knowledge_documents` table. Deterministic lexical relevance (title/tag/body token overlap), real rows only.
- **Planned providers** — Markdown, PDF, HTML, Git, GitHub/GitLab Wiki, Confluence, SharePoint, Google Drive, OneDrive, MediaWiki, Elastic/OpenSearch, Vector Store. These register so the catalog is complete and a real connector plugs in by swapping the instance — until configured they honestly report `operational: false` and return **no** results (never simulated).

Add a connector: implement `KnowledgeSource` , register it in `AppServiceProvider::boot()` . Nothing else changes.

Enterprise Search (keyword + semantic)

`EnterpriseSearchService` provides one search across modules: knowledge documents (via the registry) plus first-party operational entities (incidents, tickets, notifications, workflows, runbooks). Results are unified, ranked by a deterministic relevance score, and **workspace-scoped**. `mode=semantic`

applies the same deterministic token-overlap ranking (honest "semantic-style" relevance) unless a real vector source is registered and operational. **Only real indexed data is returned.**

Enterprise Knowledge Graph v2

`KnowledgeGraphService` builds a deterministic, bounded read-model graph over the workspace's real entities — project, incidents, assets, alerts, workflows, runbooks, automation executions, tickets, documents, notifications — with typed nodes and traversable relationships from real foreign keys and deterministic UUID soft-references. No fabricated nodes or edges.

Knowledge Assistant

Reuses Quenyx AI through `ModuleAiNarrator`. Capabilities (all editable, never fabricated, never auto-published):

- **Explain / Summarize** a document.
- **Find related** across the workspace (search-grounded).
- **Generate drafts**: KB article, incident summary, executive summary, technical summary, runbook.
- **Copilot** — a grounded conversation reusing the shared Quenyx AI conversation surface.

API (UUID-only, `workspace` required)

Base: `/api/qynknow` (Sanctum + `throttle:ai-workspace`). Reads/search require `accessAi`; document writes require `administerAi`; AI surfaces require `can_use_ai`.

Method	Endpoint	Purpose
GET	<code>/sources</code>	Knowledge Source Registry catalog
GET/POST	<code>/documents</code>	List / create documents
GET/PUT/DELETE	<code>/documents/{uuid}</code>	Read / update / delete a document
GET	<code>/search?q=</code>	Enterprise Search (mode=keyword)
GET	<code>/timeline</code>	Global Timeline
GET	<code>/graph</code>	Knowledge Graph v2
GET	<code>/intelligence/overview</code>	Knowledge overview
POST	<code>/intelligence/copilot</code>	Knowledge Assistant copilot
POST	<code>/intelligence/related</code>	Find related
POST	<code>/intelligence/draft</code>	Generate editable draft
POST	<code>/intelligence/documents/{uuid}/explain</code>	Explain a document
POST	<code>/intelligence/documents/{uuid}/summarize</code>	Summarize a document

Guarantees

Registry-driven · real indexed data only · never fabricated · drafts always editable and never auto-published · workspace isolation · RBAC · UUID-only · audited · EN/AR.
