Service Desk Guide (QynSupport)

What QynSupport is

QynSupport is the enterprise **Service Desk**. Sprint 24 adds **Ticket Intelligence**: evidence-based AI triage that suggests category, priority, impact, assignee, and SLA, and surfaces related incidents, assets, and runbooks. Suggestions are **editable and never auto-applied** — operator-confirmed fields are always authoritative.

Tickets

Tickets (`tickets` table) are workspace-scoped and UUID-addressed, with a human reference (`TCK-XXXXXX`). Cross-module links to incidents and assets are stored as deterministic UUID soft-references (no module branching). Lifecycle: `open` → `in_progress` → `pending` → `resolved` → `closed` .

Ticket Intelligence (evidence-based)

`TicketIntelligenceService` computes a deterministic suggestion set from the ticket content and the workspace's real history, then narrates the rationale through the shared `ModuleAiNarrator` :

- **Category** — inferred from ticket text (access/network/hardware/software/security/incident/request).
- **Priority** — escalated deterministically on signals like *outage*, *down*, *breach*, *urgent*.
- **Impact** — derived from priority (org/service/team/individual).
- **Suggested SLA** — from the configurable per-priority SLA matrix (`config/knowledge.php`).
- **Suggested assignee** — the member who resolved the most tickets in the suggested category; reports "**insufficient evidence**" honestly when there is no history (never invents a name).
- **Related incidents / runbooks** — via Enterprise Search over real rows.

The AI rationale is generated from this evidence only; with AI disabled the mock provider answers (flagged) while the evidence stays real.

Collaboration

Every ticket reuses the shared **Collaboration Platform** (comments, mentions, watchers, assignees) — see the Collaboration Guide. There is no ticket-specific comment system.

API (UUID-only, `workspace` required)

Base: `/api/qynsupport` (Sanctum + `throttle:ai-workspace`). Reads/writes require `accessAi` ; AI surfaces require `can_use_ai` .

Method	Endpoint	Purpose
GET/POST	/tickets	List / create tickets
GET/PUT	/tickets/{uuid}	Read / update a ticket
POST	/tickets/{uuid}/intelligence/analyze	Evidence-based triage suggestions + AI rationale
POST	/tickets/{uuid}/intelligence/copilot	Ticket copilot (grounded conversation)

Guarantees

Evidence-based · editable · never auto-applied · honest "insufficient evidence" · workspace isolation · RBAC · UUID-only · audited · EN/AR.
